

## Take Home Assignment 1

1. A cylindrical container is to be manufactured with a volume of 200 cubic centimeters. The cylinder will be cut from sheets of stainless steel that cost \$50.00/ m<sup>2</sup>, and the caps will be cut from sheets of a different grade of stainless steel that cost \$75.00/ m<sup>2</sup>. Find the dimensions of the can that minimize the cost of the materials.

Find the rate of change  $dC/dV$  of the (minimal) materials-cost ( $C$ ) of the container with respect to its volume ( $V$ ).

2. Find the average distance to the origin of points in the ball

$$x^2 + y^2 + z^2 = R^2.$$

3. Find the *singular value decomposition* of the matrix

$$A = \begin{bmatrix} 3 & 2 & 2 \\ 2 & 3 & -2 \end{bmatrix}.$$

4. Find an orthogonal transformation of  $\mathbb{R}^3$  that transforms the quadratic form

$$Q(x, y, z) = x^2 + 2xy + 4xz + 2y^2 + 2yz + z^2$$

to the diagonal form

$$\mathcal{Q}(u, v, w) = \alpha u^2 + \beta v^2 + \gamma w^2$$

(and find the coefficients  $\alpha, \beta$  and  $\gamma$ ).

5. Find the unit tangent, normal and binormal,  $\hat{\mathbf{t}}, \hat{\mathbf{n}}, \hat{\mathbf{b}}$ , and the curvature  $\kappa$  as functions of  $t$  for the helix

$$\mathbf{r}(t) = a \cos(\omega t)\mathbf{i} + a \sin(\omega t)\mathbf{j} + bt\mathbf{k}.$$

6. A function  $\varphi(x, y, z)$  (a scalar field) is called *radial* if it is constant on spheres around the origin, i.e.,  $\varphi(x, y, z) = \varphi(r)$ , where  $r = \sqrt{x^2 + y^2 + z^2}$ .

a. What is the Laplacian of a radial function? (Suggestion: use spherical coordinates).

b. A function  $u(x, y, z)$  is *harmonic* if  $\nabla^2 u = 0$ . Show that a radial harmonic function  $u(x, y, z)$  defined in all of  $\mathbb{R}^3$  must be constant.
